

Amendment to the specification.

At page 4, line 8, replace the following paragraphs,

---

--The control circuit 20 receives the control pulses signal from the control pulse sensor 16 in order to locate the tracks on the tape 6 and to stop the tape at a ~~correction~~ correct location as will now be described.

Figure 3a and 3c respectively represent the control current voltages at wire S1 and the control rotation direction at wire D during a step in slow-motion mode reproduction. This step allows the tape 6 to be drawn from one track to the next at the level of the drum 4. The tape is then stopped ~~for a while~~ for a while ~~the same image being~~ is replayed and displayed } before the next step.--
